RECOMMENDED STANDARD

CCSDS 902.1-B-1

BLUE BOOK
May 2018
This document has been approved for publication by the Management Council of the Consultative Committee for Space Data Systems (CCSDS) and represents the consensus technical agreement of the participating CCSDS Member Agencies. The procedure for review and authorization of CCSDS documents is detailed in *Organization and Processes for the Consultative Committee for Space Data Systems* (CCSDS A02.1-Y-4), and the record of Agency participation in the authorization of this document can be obtained from the CCSDS Secretariat at the e-mail address below.

This document is published and maintained by:

CCSDS Secretariat
National Aeronautics and Space Administration
Washington, DC, USA
E-mail: secretariat@mailman.ccsds.org
STATEMENT OF INTENT

The Consultative Committee for Space Data Systems (CCSDS) is an organization officially established by the management of its members. The Committee meets periodically to address data systems problems that are common to all participants, and to formulate sound technical solutions to these problems. Inasmuch as participation in the CCSDS is completely voluntary, the results of Committee actions are termed Recommended Standards and are not considered binding on any Agency.

This Recommended Standard is issued by, and represents the consensus of, the CCSDS members. Endorsement of this Recommendation is entirely voluntary. Endorsement, however, indicates the following understandings:

- Whenever a member establishes a CCSDS-related standard, this standard will be in accord with the relevant Recommended Standard. Establishing such a standard does not preclude other provisions which a member may develop.
- Whenever a member establishes a CCSDS-related standard, that member will provide other CCSDS members with the following information:
  -- The standard itself.
  -- The anticipated date of initial operational capability.
  -- The anticipated duration of operational service.
- Specific service arrangements shall be made via memoranda of agreement. Neither this Recommended Standard nor any ensuing standard is a substitute for a memorandum of agreement.

No later than five years from its date of issuance, this Recommended Standard will be reviewed by the CCSDS to determine whether it should: (1) remain in effect without change; (2) be changed to reflect the impact of new technologies, new requirements, or new directions; or (3) be retired or canceled.

In those instances when a new version of a Recommended Standard is issued, existing CCSDS-related member standards and implementations are not negated or deemed to be non-CCSDS compatible. It is the responsibility of each member to determine when such standards or implementations are to be modified. Each member is, however, strongly encouraged to direct planning for its new standards and implementations towards the later version of the Recommended Standard.
FOREWORD

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CCSDS has processes for identifying patent issues and for securing from the patent holder agreement that all licensing policies are reasonable and non-discriminatory. However, CCSDS does not have a patent law staff, and CCSDS shall not be held responsible for identifying any or all such patent rights.

Through the process of normal evolution, it is expected that expansion, deletion, or modification of this document may occur. This Recommended Standard is therefore subject to CCSDS document management and change control procedures, which are defined in Organization and Processes for the Consultative Committee for Space Data Systems (CCSDS A02.1-Y-4). Current versions of CCSDS documents are maintained at the CCSDS Web site:

http://www.ccsds.org/

Questions relating to the contents or status of this document should be sent to the CCSDS Secretariat at the e-mail address indicated on page i.
At time of publication, the active Member and Observer Agencies of the CCSDS were:

Member Agencies
- Agenzia Spaziale Italiana (ASI)/Italy.
- Canadian Space Agency (CSA)/Canada.

1 INTRODUCTION

1.1 PURPOSE AND SCOPE

1.1.1 PURPOSE

This Simple Schedule Format Recommended Standard specifies a standard format for use in transferring scheduling information related to apertures at ground stations and/or relay satellites between space agencies and commercial or governmental spacecraft operators. Such exchanges are used in:

a) mission design, e.g., in investigating the feasibility of a mission with respect to its uplink/downlink requirements and the availability of suitable apertures;

b) mission planning, e.g., to ensure that there are sufficient aperture resources available to carry out the planned operations;

c) mission operations, e.g., to

1) inform the spacecraft operator of the actual allocation of apertures to their mission;

2) inform the spacecraft operator of any unused times of the apertures;

3) return the results of a query about apertures.

1.1.2 SCOPE

The scope of this Recommended Standard is limited to the exchange of Simple Schedule information. The contents of the simple schedule format described here were derived from the analysis of the standard schedule formats used by a number of space agencies/part of space agencies. This analysis led to the identification of a ‘core’ content that was (almost) universally present in all schedules analyzed. It was, however, also identified that there was a need to permit some extension to the core content to cover some use cases. Consequently an extension mechanism has been provided that can be used to add further information in the eventuality that the core content is insufficient for the required purpose.

Definition of the extended content for any specific case is outside the scope of this Recommended Standard and should be specified in an Interface Control Document (ICD) agreed upon among the involved parties.

While this Recommended Standard has been developed within the scope of the Space Communication Cross Support Service Management (SCCS SM) (references [E1] and [E2]) activity, it is intended that the Simple Schedule Format can be used to exchange schedule information where no other use of SCCS SM is made. In view of this, schedule data that is only of relevance when used in the scope of SCCS SM has been made optional. Thus there is no limiting dependency on Service Management in the Simple Schedule Format specification.
Figure 1-1 puts the Simple Schedule Format Specification into context with the various standards that together form the Space Communication Cross Support Service Management.

Figure 1-1: Simple Schedule Format in the Context of Space Communication Cross Support Service Management

1.2 APPLICABILITY

This Recommended Standard is applicable only to the schedule format and content, but not to its transmission. With respect to the transmission of the Simple Schedule between agencies and operators there are two scenarios:

a) The first involves exchange of the Simple Schedule within the context of SCCS SM.

b) The second involves exchange of the Simple Schedule outside the scope of SCCS SM. Here the mechanism by which the Simple Schedule is transmitted is outside of the scope of this document and should be specified in an ICD agreed by the parties involved.

1.3 RATIONALE

1.3.1 GENERAL

The primary goal of CCSDS is to increase the level of interoperability among agencies. This Recommended Standard furthers that goal by establishing the means to exchange schedule information where most cross support activity occurs: between the tracking stations or ground data handling systems of various agencies and the mission-specific components of a mission ground system.

The use cases described in the following subsections were considered in deriving this Recommended Standard.
1.3.2 USE CASES

1.3.2.1 Mission Design

During the design phase of a mission it is often desirable to be able to obtain some idea of aperture availability so that the feasibility of obtaining the required uplink and downlink bandwidth can be assessed. Typically, during the mission design phase, the information required relates to periods several years in the future. Currently there is no standardized way for obtaining this information from different agencies.

While this Recommended Standard does not address the mechanism by which the required schedule information can be requested (this possibly being covered in the negotiations involved in establishing the service agreement), it provides a standard format in which the possible availability of apertures can be returned.

1.3.2.2 Mission Planning

In the mission planning use case the provider agency provides the user agency with a schedule that gives the user agency the information it requires to plan its spacecraft operations with respect to the availability of uplink/downlink resources. The means by which the provider agency determines the availability for the user agency can be either:

a) derived from a request from the user agency;

NOTE – The contents and format of such a request are outside the scope of this Recommended Standard (although this may be addressed elsewhere in the SCCS SM Recommended Standard at a later date).

b) derived from what is specified in the service agreement between the agencies.

The planning process will typically go through a number of cycles, starting months before the actual activities are expected to take place and being finalized a few days before execution. During these planning cycles the status of the schedule can change with the initial exchanges being of a ‘provisional’ schedule that is likely to change. The final schedule provided is typically considered as ‘operational’ and can be expected to provide the actual schedule that will be executed, subject to unexpected events such as equipment failure or spacecraft emergencies.

1.3.2.3 Dissemination of Provider Cross Support Service System (CSSS)\(^1\) Schedules

It is desirable that a standardized approach be available for disseminating Provider CSSS schedules, both between agencies and also within agencies. This Recommended Standard aims to provide that. There are, however, differences in policies between agencies with regard to the contents of distributed schedules. Some agencies provide complete schedules to

---

\(^1\) A Provider Cross Support Service System is often colloquially referred to as a Network.
all users, containing information regarding all spacecraft supported by the agency (and possibly unallocated time as well). At the other extreme, other agencies provide only details regarding a spacecraft’s allocation to the operators of that mission.

In view of this, this Recommended Standard has been designed to be flexible enough to be able to cope with the different policies of the various agencies with respect to the information they wish to provide in disseminating their schedules.

1.3.2.4 Dissemination of Unallocated Time Schedules

Some agencies publish a list of unallocated time of the apertures in their network. This information can be used by missions to see if it is possible to request additional coverage by using resources during periods when they would otherwise be unused.

Although not addressing the method by which the usage of unallocated resources can be requested, this Recommended Standard can be used to publish a Provider CSSS unallocated time schedule. It can also be used to inform a mission of the result of a request to use an unallocated resource.

1.3.2.5 Response to Schedule Query

The final use case of the Simple Schedule Format is to return schedule information resulting from a query about resource availability. While the contents and format of such a query are outside the scope of this Recommended Standard, the Simple Schedule Format provides a standard mechanism by which the information can be returned to the requestor. The ability to submit queries and the contents of these will depend on the capabilities and policies of the agency, but, for example, providing the agencies policy permits, it could be used by a mission to find unallocated aperture times which they could then request the use of.

1.4 DOCUMENT STRUCTURE

This document is organized as follows:

a) Section 1 provides the purpose, scope, applicability, and rationale of this Recommended Standard and identifies the conventions and references used throughout the document. This section also describes how this document is organized. A brief description is provided for each section and annex so that the reader will have an idea of where information can be found in the document. It also identifies terminology that is used in this document but is defined elsewhere.

b) Section 2 provides a brief overview of the CCSDS-recommended Simple Schedule Format.
c) Section 3 provides details about the structure and content of the Simple Schedule Format and specifies the normative files that define the XML schemas that govern the content of the XML instance documents that carry Simple Schedules.

d) Annex A provides the normative Implementation Conformance Statement (ICS) proforma.

e) Annex B discusses security, SANA, and patent considerations.

f) Annex C provides an informative listing of the normative XML schema that realizes the classes that comprise the Simple Schedule Format.

g) Annex D contains a list of abbreviations applicable to the Simple Schedule Format.

h) Annex E is a list of informative references.

1.5 DEFINITIONS

For the purposes of this document, the following definitions apply:

agency: A space agency.

NOTE – The word ‘agencies’ may also be construed as meaning ‘satellite operators’ or ‘satellite service providers’;

n/a: Not applicable.

1.6 NOMENCLATURE

1.6.1 NORMATIVE TEXT

The following conventions apply for the normative specifications in this Recommended Standard:

a) the words ‘shall’ and ‘must’ imply a binding and verifiable specification;

b) the word ‘should’ implies an optional, but desirable, specification;

c) the word ‘may’ implies an optional specification;

d) the words ‘is’, ‘are’, and ‘will’ imply statements of fact.

NOTE – These conventions do not imply constraints on diction in text that is clearly informative in nature.
1.6.2 INFORMATIVE TEXT

In the normative sections of this document, informative text is set off from the normative specifications either in notes or under one of the following subsection headings:

- Overview;
- Background;
- Rationale;
- Discussion.

1.7 CONVENTIONS—THE UNIFIED MODELING LANGUAGE

The Unified Modeling Language (UML) diagrams used in the specification (including class diagrams, package diagrams, sequence diagrams, and activity diagrams) follow the notation, semantics, and conventions imposed by the Version 2.4.1 UML specification of the Object Management Group (OMG) (reference [4]). An overview of UML diagramming conventions can be found in annex E of reference [1].

Within the document use is made only of class diagrams. A UML class diagram describes the structure of a message, its parts, and how those parts interrelate. A UML class, represented in the diagram as a box, represents a data set. Class diagram conventions include composition, generalization, multiplicity, and constraints. Enumeration notation is also used but only when it is involved in a composition constraint.

1.8 REFERENCES

The following publications contain provisions which, through reference in this text, constitute provisions of this document. At the time of publication, the editions indicated were valid. All publications are subject to revision, and users of this document are encouraged to investigate the possibility of applying the most recent editions of the publications indicated below. The CCSDS Secretariat maintains a register of currently valid CCSDS publications.

2 OVERVIEW

2.1 GENERAL

This section provides a high-level overview of the CCSDS-recommended Simple Schedule Format, which is designed to facilitate standardized exchanges of aperture schedule information between space agencies.

2.2 SIMPLE SCHEDULE

A Simple Schedule file is XML formatted. The format of the Simple Schedule file is suitable for automated interaction and/or (by means of a suitable XML viewer) human interaction.

Data in the Simple Schedule is either mandatory, in which case suitable values must be present, or optional, in which case values may be present or not. In addition it is possible to extend the contents of the Simple Schedule by defining additional parameters. The content of any additional parameters so defined is outside the scope of this document and should be documented in an ICD agreed upon by the involved parties.

2.3 MAPPING TO W3C XML SCHEMA

This Recommended Standard includes the specification of a mapping to World Wide Web Consortium (W3C) extensible Markup Language (XML) schema. The normative mapping of this Recommended Standard to XML W3C schemas is a virtual annex to this Recommended Standard and is contained in a stand-alone set of schema files (reference [2]).

NOTE – The XML schema has been elaborated on the basis of the mapping guidelines described in reference [E1].
3 SIMPLE SCHEDULE

3.1 GENERAL

The Simple Schedule shall consist of digital data exchanged in the form of a file containing an XML instance document.

NOTE – Subsection 3.6 identifies the files that contain the normative Simple Schedule XML schemas. The naming conventions for the files containing the Simple Schedule XML instance documents are outside of the scope of this recommended standard.

3.2 SIMPLE SCHEDULE CONTENT/STRUCTURE

3.2.1 OVERVIEW

Figure 3-1 shows the UML Class diagram for the Simple Schedule. For clarity, abstract classes are highlighted in green.
The attributes of each class are described further in the following subsections and tables.

NOTES

1 In the following tables, data types specified as ‘xsd:nnn’ are XML schema types. Thus, for example, ‘xsd:string’ indicates that the type is an XML schema string.

2 In general the length of strings in this Recommended Standard is unbounded; i.e., no length is specified (in practice there is obviously the constraint of the maximum string length supported). However, in a number of cases, in the various SANA registries used, a length for string values in specified. For these cases the effective restriction on string length is the value specified in the SANA registry definition.

3.2.2 CLASS SimpleSchedule

3.2.2.1 The SimpleSchedule class is mandatory and shall constitute the Simple Schedule information entity.

NOTE – The SimpleSchedule class is a specialization of class SrvMgtInfoEntity described in reference [7], and the generic description of the parameters is given in there.

3.2.2.2 The use of the parameters in the SrvMgtInfoEntity in the scope of the Simple Schedule shall be as specified in table 3-1.

Table 3-1: Class SimpleSchedule Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

<th>Data Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not applicable.</td>
<td>(See reference [7], subsection 3.1.2)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
3.2.3 CLASS SimpleScheduleHeader

3.2.3.1 The SimpleScheduleHeader class is mandatory and shall constitute the ‘header’ of the Simple Schedule.

NOTE – The SimpleScheduleHeader class is a specialization of class SrvMgtHeader described in reference [7], and the generic description of the parameters is given there.

3.2.3.2 Each instance of the SimpleScheduleHeader class may have zero or more instances of parameter classes derived from the abstract AbstractParameter class described in reference [7]. Usage of any additional parameters so specified is not within the scope of this document and should be specified in an ICD between by the relevant parties.

3.2.3.3 The SimpleScheduleHeader class, in addition to the parameters in the abstract SrvMgtHeader class, described in reference [7], shall contain parameters as specified in table 3-2.

3.2.3.4 The parameter inclusionType of the SimpleScheduleHeader shall be used to specify the type of inclusion rule that has been used to select the ScheduledPackages (see 3.2.4) that are contained in the schedule.

3.2.3.5 Two types of inclusion rules are supported and are discussed below; the following shall apply to both types:

  a) The start time of a ScheduledPackage ($t_{ssp}$) is defined to be the earliest beginningOfActivity or beginningOfTrack time of any ScheduledActivity (see 3.2.7) contained within that ScheduledPackage.

  b) The end time of a ScheduledPackage ($t_{esp}$) is defined to be the latest endOfActivity or endOfTrack time of any ScheduledActivity contained within that ScheduledPackage.

3.2.3.6 In the case of inclusion type OVERLAP_INCLUSION where the startTime and endTime specified in the SimpleScheduleHeader are respectively $T_s$ and $T_e$, ScheduledPackages shall be included in the schedule where:

$$t_{esp} > T_s \text{ and } t_{ssp} < T_e$$

3.2.3.7 In the case of inclusion type START_INCLUSION, in the event that one or more ScheduledPackage are associated via a ScheduledPkgAssn (see 3.2.5), the start time of the associated ScheduledPackages ($t_{sasp}$) is defined to be the earliest ScheduledPackage time ($t_{ssp}$) of the associated ScheduledPackages; thus where the startTime and endTime specified in the SimpleScheduleHeader are respectively $T_s$ and $T_e$, ScheduledPackages shall be included in the schedule where:

$$t_{ssp} \geq T_s \text{ and } t_{ssp} < T_e \text{ (ScheduledPackage is not associated with other ScheduledPackages)}$$

or

$$t_{sasp} \geq T_s \text{ and } t_{sasp} < T_e \text{ (ScheduledPackage associated with other ScheduledPackages).}$$
NOTES

1 It is implicit in the above definition of the inclusion type START_INCLUSION that if the criteria $t_{sasp} \geq T_s$ and $t_{sasp} < T_e$ are satisfied for a set of associated ScheduledPackages then all of the associated ScheduledPackages will appear in the schedule even though individual ServicePackages in the association may not satisfy the $t_{ssp} \geq T_s$ and $t_{ssp} < T_e$ criteria.

2 Similarly, if the criteria $t_{sasp} \geq T_s$ and $t_{sasp} < T_e$ is not satisfied for a set of associated ScheduledPackages, then none of the associated ScheduledPackages will appear in the schedule even though individual ServicePackages in the association may satisfy the $t_{ssp} \geq T_s$ and $t_{ssp} < T_e$ criteria.

<td>UTC</td>
</tr>
<tr>
<td>endTime</td>
<td>Mandatory parameter for the Simple Schedule. The end time of the simple schedule contained.</td>
<td>CCSDS ASCII Time Code B (reference [3])</td>
<td>UTC</td>
</tr>
</tbody>
</table>

NOTE – Permitted combinations of parameters SimpleScheduleHeader—status, ScheduledPackage—user, ServiceInfo—serviceType, and ScheduledActivity—activityStatus are specified in 3.3.

3.2.4 CLASS ScheduledPackage

3.2.4.1 The ScheduledPackage class is optional and may be used to specify the information for service packages that have been scheduled in the time interval bounded by the SimpleSchedule parameters startTime and endTime.

NOTE – The ScheduledPackage class is a specialization of class SrvMgtData described in reference [7]. The abstract SrvMgtData class contains zero parameters.

3.2.4.2 There shall be zero or more instances of the ScheduledPackage class for each instance of the SimpleSchedule class.

3.2.4.3 There shall be one or more instances of the ScheduledActivityClass for each instance of the ScheduledPackage Class.

3.2.4.4 There shall be zero or one instances of the ServicePackageXRef class for each instance of the ScheduledPackage Class.

3.2.4.5 Each instance of the ScheduledPackage class may have zero or more instances of parameter classes derived from the abstract AbstractParameter class described in reference [7]. Usage of any additional parameters so specified is not within the scope of this document and should be specified in an ICD between the relevant parties.

3.2.4.6 The ScheduledPackage class shall extend the SrvMgtData class with the parameters specified in table 3-6.

3.2.4.7 The scheduledPackageID must be unique for every scheduled package in a schedule.

3.2.4.8 The user shall be one of

   a) a spacecraft (the typical case);
b) PROVIDER-CSSS (indicating that the time is allocated to the Provider CSSS for tests, maintenance, upgrades, etc.); or

c) UNALLOCATED (indicating that the aperture is unallocated during the specified time range).

NOTE – The case for zero instances of the ScheduledPackage is where a Simple Schedule has been returned as a result of a query. In this case it is possible that no ScheduledPackages are scheduled in the time range specified. As noted in 1.3.2.5 the contents and format of such a query are outside the scope of this Recommended Standard.

<tr>
<td></td>
<td>that caused the scheduled package to be generated.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
3.2.4.9 The xsd:ID type is used for an attribute that uniquely identifies an element in an XML document. An xsd:ID value must be an NCName. This means that it must start with a letter or underscore, and can only contain letters, digits, underscores, hyphens, and periods. xsd:ID carries several additional constraints:

a) Their values must be unique within an XML instance, regardless of the attribute’s name or its element name.

b) A complex type cannot include more than one attribute of type xsd:ID, or any type derived from xsd:ID.

c) xsd:ID attributes cannot have default or fixed values specified.

NOTE – Permitted combinations of parameters SimpleScheduleHeader—status, ScheduledPackage—user, ServiceInfo—serviceType, and ScheduledActivity—activityStatus are specified in 3.3.

3.2.5 CLASS ScheduledPkgAssn

3.2.5.1 The ScheduledPkgAssn class is optional and may be used to specify associations between scheduled packages.

NOTES

1 This may be useful in the case where there may be dependencies between scheduled packages on two or more antennas (e.g., Delta-Differential One-way Range [Delta-DOR] measurements), or where there are two or more spacecraft using the same aperture at the same time (Multiple Spacecraft per Aperture [MSPA]).

2 The ScheduledPkgAssn class is a specialization of class SrvMgtData described in reference [7]. The abstract SrvMgtData class contains zero parameters.

3.2.5.2 There shall be zero or more instances of the ScheduledPkgAssn class for each instance of the SimpleSchedule class.

3.2.5.3 Each instance of the ScheduledPkgAssn class may have zero or more instances of parameter classes derived from the abstract AbstractParameter class described in reference [7]. Usage of any additional parameters so specified is not within the scope of this document and should be specified in an ICD between the relevant parties.

3.2.5.4 The ScheduledPkgAssn class shall extend the SrvMgtData class with the parameters specified in table 3-5.
### Table 3-5: Class ScheduledPkgAssn Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Data Type</th>
<th>Data Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>associationId</td>
<td>An identifier that uniquely identifies the association. This is assigned by the Provider CSSS. It should be noted that if a schedule is regenerated then the associationId for a particular scheduled package association may change</td>
<td>xsd:string</td>
<td>n/a</td>
</tr>
<tr>
<td>associationKind</td>
<td>The type of the association. Permitted values are registered in SANA (see B2.5 for further information).</td>
<td>xsd:string</td>
<td>n/a</td>
</tr>
<tr>
<td>comment</td>
<td>Optional parameter: may be used for the provision of ad hoc information. Exact use of this may be specified in an ICD between relevant parties.</td>
<td>xsd:string</td>
<td>n/a</td>
</tr>
<tr>
<td>scheduledPackageIdRef</td>
<td>A list of the scheduledPackageIds (see table 3-4) of the scheduled packages that are associated.</td>
<td>Array of xsd:IDREF</td>
<td>n/a</td>
</tr>
<tr>
<td>externalSchedPkgIdRef</td>
<td>Optional parameter: may be used to indicate association to scheduled packages that are not contained in the current file.</td>
<td>Array of xsd:string</td>
<td>n/a</td>
</tr>
</tbody>
</table>

3.2.5.5 The xsd:IDREF type shall be used for an attribute that references an ID:

a) all attributes of type xsd:IDREF must reference an xsd:ID in the same XML document;

b) as with ID, an xsd:IDREF value must be an NCName.

3.2.5.6 For a ScheduledPkgAssn to be valid it must refer to a least one scheduled package that is in the same xml document (file).

3.2.5.7 If it is required in a ScheduledPkgAssn to refer to scheduled packages that are not contained in the same xml document (e.g., not contained in the time range covered by the simple schedule contained in the file or, in the case for Delta-DOR, for example, from another Provider CSSS), then the appropriate reference(s) shall be placed in the externalSchedPkgIdRef parameter.
3.2.6 CLASS ServicePackageXRef

3.2.6.1 The ServicePackageXRef class is optional and may be used to map the contents of the Simple Schedule to the appropriate SCCS SM service packages.

3.2.6.2 There shall be zero or one instance of the ServicePackageXRef class for each instance of the ScheduledPackage class.

3.2.6.3 The ServicePackageXRef class shall include the parameters specified in table 3-6.

NOTE – The contents of the ServicePackageXRef class are relevant only when the Simple Schedule is used in the context of SCCS SM.

Table 3-6: Class ServicePackageXRef Parameters

<td>n/a</td>
</tr>
<tr>
<td>servicePackageRef</td>
<td>Cross-reference to the service package (as per CCSDS 910.11-B-1, reference [1]; see also reference [E2] for additional information), where the aperture allocation is contained in the event that the aperture allocation was obtained via SCCS SM. NOTE – Several ScheduledActivity instances may have the same servicePackageRef since one service package can contain a number of aperture allocations.</td>
<td>xsd:string</td>
<td>n/a</td>
</tr>
</tbody>
</table>

3.2.7 CLASS ScheduledActivity

3.2.7.1 The ScheduledActivity class shall contain the details of the scheduled activity and shall include parameters specified in table 3-7.

3.2.7.2 The ScheduledActivity class shall include two time windows,

a) the interval within which the aperture is allocated (optional);

b) the interval within the first window within which the spacecraft is actually being tracked by the aperture.

3.2.7.3 There shall be at least one instance of the ScheduledActivity class for each instance of the ScheduledPackage class.

3.2.7.4 There shall be one or more instances of the ServiceInfo class for each instance of the ScheduledActivity Class.
3.2.7.5 Each instance of the ScheduledActivity class may have zero or more instances of parameter classes derived from the abstract AbstractParameter class described in reference [7]. Usage of any additional parameters so specified is not within the scope of this document and should be specified in an ICD between by the relevant parties.

<td></td>
<td>CCSDS ASCII Time Code B (reference [3])</td>
<td>UTC</td>
</tr>
<tr>
<td>orbitNumber</td>
<td>Optional parameter. The Orbit Number on which the <code>beginningOfTrack</code> occurs. If this is not relevant (e.g., deep space missions) or not available, this parameter shall be omitted.</td>
<td>xsd:integer≥0</td>
<td>n/a</td>
</tr>
</tbody>
</table>

**NOTE** – Permitted combinations of parameters `SimpleScheduleHeader—status`, `ScheduledPackage—user`, `ServiceInfo—serviceType`, and `ScheduledActivity—activityStatus` are specified in 3.3.
3.2.8 CLASS ServiceInfo

3.2.8.1 The ServiceInfo class shall be used to provide information about the type of operations to be carried out during a pass.

3.2.8.2 The ServiceInfo class shall use the parameters specified in table 3-8 to specify the type of service and frequency band to be used.

3.2.8.3 There shall be at least one instance of the ServiceInfo class for each instance of the ScheduledActivity class.

NOTE – Multiple instances of the ServiceInfo Class are required where more than one service is provided during a pass; e.g.,

a) Telemetry and telecommanding services are provided;

b) Telemetry is downlinked on both X- and S-band simultaneously.

3.2.8.4 Each instance of the ServiceInfo class may have zero or more instances of parameter classes derived from the abstract AbstractParameter class described in reference [7]. Usage of any additional parameters so specified is not within the scope of this document and should be specified in an ICD between by the relevant parties.
### Table 3-8: Class ServiceInfo Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Data Type</th>
<th>Data Units</th>
<th>Units</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceType</td>
<td>The type of service that will be carried out during an activity. It should be noted that: APA-AZ/EL indicates Antenna Pointing Angles, Azimuth/Elevation; APA-X/Y indicates Antenna Pointing Angles, X/Y; VLBI indicates Very-Long-Baseline Interferometry.</td>
<td>Enumeration</td>
<td>n/a</td>
<td></td>
</tr>
<tr>
<td>frequencyBand</td>
<td>The frequency band that will be used by the service. (See table 2-1 in reference [8] for a definition of the frequencies each band refers to.) If the frequency band is not relevant the value N/A (not applicable) shall be used. If the frequency band to be used is not defined in table 2-1 in reference [8] then the value OTHER shall be used. For use of the value ALL see 3.2.8.5, below.</td>
<td>Enumeration</td>
<td>n/a</td>
<td></td>
</tr>
</tbody>
</table>

#### 3.2.8.5
For the case of unused time it is possible (but not mandatory) to specify a frequency band. To specify the unused time on a particular band of an Aperture the following shall be specified:

a) **ScheduledPackage**—user parameter set to UNALLOCATED;
b) **ScheduledActivity**—siteRef parameter set as appropriate;
c) **ScheduledActivity**—apertureRef parameter set as appropriate;
d) **ServiceInfo**—serviceType parameter set to UNUSED;
e) **ServiceInfo**—frequencyBand set to either
   1) the appropriate frequency band as contained in table 2-1 in reference [8]; or
   2) the value ALL if all frequency bands supported by the aperture are UNUSED.
NOTE – Permitted combinations of parameters SimpleScheduleHeader—status, ScheduledPackage—user, ServiceInfo—serviceType, and ScheduledActivity—activityStatus are specified in 3.3.

3.2.9 CLASS AbstractParameter (ABSTRACT)

The AbstractParameter is an abstract class and is fully defined in reference [7].

3.3 PERMITTED COMBINATIONS OF PARAMETERS SimpleScheduleHeader—status, ScheduledPackage—user, ServiceInfo—serviceType, AND ScheduledActivity—activityStatus

3.3.1 The permitted combinations of the following parameters shall be those specified in table 3-9:

a) SimpleScheduleHeader—status;

b) ScheduledPackage—user;

c) ServiceInfo—serviceType;

d) ScheduledActivity—activityStatus.

3.4 ORDERING OF SCHEDULED PACKAGES

3.4.1 The ordering of ScheduledPackages in a file containing a Simple Schedule shall be by increasing order of the earliest beginningOfTrack times of all the ScheduledActivities contained in a ScheduledPackage.

3.4.2 In the event that two or more ScheduledPackages contain ScheduledActivities that have the same earliest beginningOfTrack times, the user value of ScheduledPackage shall be used as a secondary key in increasing alphabetic order.

NOTE — Figure 3-2 is an example of how the order of ScheduledPackages should appear. For clarity not all parameters of ScheduledActivities are shown.
ScheduledPackage
   scheduledPackageID = Package-A
   user = Mission-A
ScheduledActivity
   scheduledActivityID = Activity-A1
   beginningOfTrack = 2020-123T12:00:00.000Z
   ...
ScheduledActivity
   scheduledActivityID = Activity-A2
   beginningOfTrack = 2020-123T12:30:00.000Z
   ...

ScheduledPackage
   scheduledPackageID = Package-B
   user = Mission-B
ScheduledActivity
   scheduledActivityID = Activity-B1
   beginningOfActivity = 2020-123T12:15:00.000Z
   beginningOfTrack = 2020-123T12:30:00.000Z
   ...
ScheduledActivity
   scheduledActivityID = Activity-B2
   beginningOfActivity = 2020-123T12:10:00.000Z
   beginningOfTrack = 2020-123T12:40:00.000Z
   ...

ScheduledPackage
   scheduledPackageID = Package-C
   user = Mission-C
ScheduledActivity
   scheduledActivityID = Activity-C1
   beginningOfActivity = 2020-123T12:00.00.000Z
   beginningOfTrack = 2020-123T12:30:00.000Z
   ...
ScheduledActivity
   scheduledActivityID = Activity-C2
   beginningOfActivity = 2020-123T12:10:00.000Z
   beginningOfTrack = 2020-123T12:40:00.000Z
   ...

ScheduledPackage
   scheduledPackageID = Package-D
   user = Mission-A

   ...
ScheduledActivity
   scheduledActivityID = Activity-A4
   beginningOfTrack = 2020-123T13:30:00.000Z
   ...

Figure 3-2: Example of Ordering of Scheduled Packages in Simple Schedule
3.5 USAGE OF SIMPLE SCHEDULE FOR SPECIFYING APERTURE AVAILABLE FREE TIME

3.5.1 DISCUSSION

Aperture Free Time, for the purposes of the Simple Schedule, is defined as those time periods outside of scheduled activities; following on from this,

- Aperture Available Free Time is aperture free time which is available for scheduling.
- Aperture Unavailable Free Time is aperture free time which is not available for scheduling.

The objective of using the simple schedule to disseminate Aperture Available Free Time is to provide a standard mechanism by which, subject to the Provider-CSSS policies, missions can be informed of time slots on apertures which are currently unused and are available for use. A detailed description of how Aperture Available Free Time can be specified is contained in 3.5.2.

It is possible for the PROVIDER-CSSS to disseminate a combined schedule that contains scheduled aperture time, i.e., time allocated to specific users, as well as Aperture Available Free Time.

The Aperture Available Free Time is specified as a UTC time range. It is not orbit- or spacecraft-specific. It should be noted that the Aperture Available Free Time may not all be available for tracking of a spacecraft; e.g., time may be required at the start and end of the time interval for station configuration, teardown, etc., and/or antenna slewing in the case of relay satellites.
Figure 3-3 indicates, diagrammatically, what is meant by Aperture Available Free Time. It should be noted that in this diagram it is assumed that all Aperture Free Time is available for use.

3.5.2 SPECIFICATION OF APERTURE AVAILABLE FREE TIME

3.5.2.1 As of this issue, Aperture Available Free Time is not user-/spacecraft-specific.

3.5.2.2 When specifying Aperture Available Free Time in the Simple Schedule Format:
   a) the ScheduledPackage—user parameter shall be specified as ‘UNALLOCATED’;
   b) the ScheduledActivity—activityStatus parameter shall be specified as ‘AVAILABLE’;

Figure 3-3: Schematic of Schedule to Illustrate Use of Simple Schedule for Aperture Free Time
c) the ScheduledActivity—beginningOfTrack parameter shall be set to the UTC time at which the Aperture Available Free Time starts;

d) the ScheduledActivity—endOfTrack parameter shall be set to the UTC time at which the Aperture Available Free Time ends;

e) The ScheduledActivity—beginningOfActivity and endOfActivity parameters shall be omitted;

f) the ServiceInfo—serviceType parameter shall be set to ‘UNUSED’;

g) the ServiceInfo frequencyBand parameter shall be set to either

1) ‘ALL’ indicating that all frequency bands supported by the aperture are available; or

2) a specific frequency band (see table 3-8 for allowed values) indicating that the aperture is free to support that frequency band only.

3.6 XML SCHEMAS FOR THE SIMPLE SCHEDULE

Each Simple Schedule Information Entity shall conform to the XML schemas specified in the files ‘SchemaCssmSimpleSchedule-v1_0_0.xsd’, ‘SchemaCssmSmInfoEntityHeader-v1_0_0.xsd’, ‘SchemaCssmCcsdsTimecodes-v1_0_0.xsd’ and ‘SchemaCssmAbstractParameter-v1_0_0.xsd’. The normative source of these files shall be the SANA SCCS-SM Information Entity XML Schemas registry:

http://sanaregistry.org/r/service_management_xml_schemas/

NOTE – Annex C provides an informative description of the Simple Schedule XML schemas.
ANNEX A

IMPLEMENTATION CONFORMANCE STATEMENT (ICS) PROFORMA

(NORMATIVE)

A1 INTRODUCTION

A1.1 OVERVIEW

This annex provides the Implementation Conformance Statement (ICS) Requirements List (RL) for an implementation of the Simple Schedule Format Specification (CCSDS 902.1-B-1). The ICS for an implementation is generated by completing the RL in accordance with the instructions below. An implementation shall satisfy the mandatory conformance requirements referenced in the RL.

The RL in this annex is blank. An implementation’s completed RL is called the ICS. The ICS states which capabilities and options have been implemented. The following can use the ICS:

- the implementer, as a checklist to reduce the risk of failure to conform to the standard through oversight;
- a supplier or potential acquirer of the implementation, as a detailed indication of the capabilities of the implementation, stated relative to the common basis for understanding provided by the standard ICS proforma;
- a user or potential user of the implementation, as a basis for initially checking the possibility of interworking with another implementation (it should be noted that, while interworking can never be guaranteed, failure to interwork can often be predicted from incompatible ICSes);
- a tester, as the basis for selecting appropriate tests against which to assess the claim for conformance of the implementation.

A1.2 ABBREVIATIONS AND CONVENTIONS

A1.2.1 General

The RL consists of information in tabular form. The status of features is indicated using the abbreviations and conventions described below.

A1.2.2 Item Column

The item column contains sequential numbers for items in the table.
A1.2.3 Feature Column

The feature column contains a brief descriptive name for a feature. It implicitly means ‘Is this feature supported by the implementation?’

NOTE – The features itemized in the RL are elements of the Simple Schedule Format. Therefore support for a mandatory feature indicates that a generated file will include that feature, and support for an optional feature indicates that generated files can include that feature.

A1.2.4 Class Column/Parameters

The Class/Parameters column contains, where applicable, the Simple Schedule Format class associated with the feature.

A1.2.5 Reference Column

The reference column indicates the relevant subsection or table in the Simple Schedule Format Specification (CCSDS 902.1-B-1) (this document).

A1.2.6 Status Column

The status column uses the following notations:

M mandatory.
O optional.
C<n> conditional as defined in corresponding expression below table.

It should be noted that a parameter may be marked as M(andatory) while the class that contains it is marked O(ptional). This should be interpreted to mean that while the class is optional if it is present then the parameter must be present.

A1.2.7 Support Column Symbols

The support column is to be used by the implementer to state whether a feature is supported by entering Y, N, or N/A, indicating:

Y Yes, supported by the implementation.
N No, not supported by the implementation.
N/A Not applicable.
A1.3 INSTRUCTIONS FOR COMPLETING THE RL

An implementer shows the extent of compliance to the Recommended Standard by completing the RL; that is, the state of compliance with all mandatory requirements and the options supported are shown. The resulting completed RL is called an ICS. The implementer shall complete the RL by entering appropriate responses in the support or values supported column, using the notation described in A1.2. If a conditional requirement is inapplicable, N/A should be used. If a mandatory requirement is not satisfied, exception information must be supplied by entering a reference $X_i$, where $i$ is a unique identifier, to an accompanying rationale for the noncompliance.

A2 ICS PROFORMA FOR SIMPLE SCHEDULE FORMAT

A2.1 GENERAL INFORMATION

A2.1.1 Identification of ICS

<table>
<thead>
<tr>
<th>Date of Statement (DD/MM/YYYY)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ICS serial number</td>
<td></td>
</tr>
<tr>
<td>System Conformance statement cross-reference</td>
<td></td>
</tr>
</tbody>
</table>

A2.1.2 Identification of Implementation Under Test (IUT)

<table>
<thead>
<tr>
<th>Implementation name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementation version</td>
<td></td>
</tr>
<tr>
<td>Special Configuration</td>
<td></td>
</tr>
<tr>
<td>Other Information</td>
<td></td>
</tr>
</tbody>
</table>

A2.1.3 Identification of Supplier

<table>
<thead>
<tr>
<th>Supplier</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Point for Queries</td>
<td></td>
</tr>
<tr>
<td>Implementation Name(s) and Versions</td>
<td></td>
</tr>
<tr>
<td>Other Information necessary for full identification, e.g., names(s) and version(s) for machines and/or operating systems;</td>
<td></td>
</tr>
</tbody>
</table>

A2.1.4 Document Version

<table>
<thead>
<tr>
<th>CCSDS 902.1-B-1, Issue 1</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Have any exceptions been required?</td>
<td>Yes _____ No _____</td>
</tr>
</tbody>
</table>

NOTE – A YES answer means that the implementation does not conform to the Recommended Standard. Non-supported mandatory capabilities are to be identified in the ICS, with an explanation of why the implementation is non-conforming.

</tbody>
</table>

A2.1.5.19.2 Class TimeParameterB Parameters

As per A2.1.5.8.1 with the addition of the following:

<table>
<thead>
<tr>
<th>Item</th>
<th>Parameter</th>
<th>Ref.</th>
<th>Status</th>
<th>Item Support or Values Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.1</td>
<td>value</td>
<td>Reference [7], Table 3-13</td>
<td>M</td>
<td></td>
</tr>
</tbody>
</table>

A2.1.5.20 Additional Parameters defined by using Classes instantiated from Class AbstractParameter

If additional parameters for classes SimpleScheduleHeader, ScheduledPackage, ScheduledPkgAssn, ScheduledActivity or ServiceInfo are specified by using one of the classes instantiated from class AbstractParameter (i.e., classes BooleanParameter, UnsignedIntParameter, IntParameter, FloatParameter, DoubleParameter, StringParameter, ExtendedParameter, DurationIntParameter, DurationDblParameter, TimeParameterA or TimeParameterB) the additional parameters and permitted values for these should be specified in tables A-1–A-5.

In the following tables the columns have the following use:

- **Name**: This column is used to specify the names of the additional parameter(s).
- **Description**: This column is used to enter the description of what the additional parameter(s) is/are.
- **Type**: This column is used to specify what type the parameter is, e.g., String, Integer, Unsigned Integer, Float, CCSDS ASCII Time Code B, etc.
- **Permitted Values**: This column is used to specify the values that are permitted for the additional parameter(s).
- **Data units**: This column is used to specify the Data Unit of the additional parameter(s), e.g., Seconds, Hertz, Volts, UTC, etc.

ANNEX B

SECURITY, SANA, AND PATENT CONSIDERATIONS

(INFORMATIVE)

B1 SECURITY CONSIDERATIONS

B1.1 OVERVIEW

This annex presents the results of an analysis of security considerations applied to the technologies specified in this Recommended Standard.

B1.2 CONSEQUENCES OF NOT APPLYING SECURITY TO THE TECHNOLOGY

The consequences of not applying security to the systems and networks on which this Recommended Standard is implemented could include potential loss, corruption, and theft of data. Since it is possible to utilize these messages in preparing and disseminating schedules relating to the availability of communications and tracking resources for spacecraft, the consequences of not applying security to the systems and networks on which this Recommended Standard is implemented could include compromise or loss of the mission if malicious tampering of a particularly severe nature occurs.

B1.3 POTENTIAL THREATS AND ATTACK SCENARIOS

Potential threats or attack scenarios include, but are not limited to, (a) unauthorized access to the programs/processes that generate and interpret the messages, and (b) unauthorized access to the messages during transmission between exchange partners. Protection from unauthorized access during transmission is especially important if the mission utilizes open ground networks such as the Internet to provide ground station connectivity for the exchange of data formatted in compliance with this Recommended Standard. It is strongly recommended that potential threats or attack scenarios applicable to the systems and networks on which this Recommended Standard is implemented be addressed by the management of those systems and networks and the utilization of adequate authentication, suitable protocols, and secured interfaces for the exchange of this information.
B1.4 SECURITY CONCERNS RELATED TO THIS RECOMMENDED STANDARD

B1.4.1 Data Privacy

Privacy of data formatted in compliance with the specifications of this Recommended Standard should be assured by the systems and networks on which this Recommended Standard is implemented.

B1.4.2 Data Integrity

Integrity of data formatted in compliance with the specifications of this Recommended Standard should be assured by the systems and networks on which this Recommended Standard is implemented.

B1.4.3 Authentication of Communicating Entities

Authentication of communicating entities involved in the transport of data which complies with the specifications of this Recommended Standard should be provided by the systems and networks on which this Recommended Standard is implemented.

B1.4.4 Data Transfer between Communicating Entities

The transfer of data formatted in compliance with this Recommended Standard between communicating entities should be accomplished via secure mechanisms approved by the Information Technology Security functionaries of exchange participants.

B1.4.5 Control of Access to Resources

Control of access to resources should be managed by the systems upon which provider formatting and recipient processing are performed.

B1.4.6 Auditing of Resource Usage

Auditing of resource usage should be handled by the management of systems and networks on which this Recommended Standard is implemented.

B1.5 UNAUTHORIZED ACCESS

Unauthorized access to the programs/processes that generate and interpret the messages should be prohibited in order to minimize potential threats and attack scenarios.

B1.6 DATA SECURITY IMPLEMENTATION SPECIFICS

Specific information-security interoperability provisions that apply between agencies and other independent users involved in an exchange of data formatted in compliance with this Recommended Standard should be specified in an ICD.
### B2 SANA CONSIDERATIONS

#### B2.1 GENERAL

The recommendations of this document rely on the SANA registries described below. New assignments in these registries, in conformance with the policies identified, will be available at the SANA registry Web site: http://sanaregistry.org. Therefore the reader shall look at the SANA Web site for all the assignments contained in these registries.

#### B2.2 REGISTRY FOR originatingOrganization

The values for originatingOrganization (see reference [7], table 3-1) are those listed in the ‘Name’ field of the CCSDS Organizations registry. The CCSDS Organization’s registry is located at

http://sanaregistry.org/r/organizations/

The CCSDS Organizations registry also list roles that organizations fulfill. Organizations that publish schedules have the ‘SchedulePublisher’ role assigned (this may be addition to other roles). The policy that governs updates to the Organizational Roles registry is that defined in subsection 3.3.2.3 of reference [5].

#### B2.3 REGISTRY FOR user

The values for the ‘user’ parameter (see table 3-4) are those listed in the ‘Spacecraft Abbreviation’ field of the CCSDS Spacecraft Identifiers registry. The Spacecraft Identifiers registry is located at

http://sanaregistry.org/r/spacecraft/

The policy that governs updates to this registry is that defined in subsection 3.3.2.1 of reference [5].

In addition to the values for the ‘user’ parameter contained in the CCSDS Spacecraft Identifiers registry, the following values need to be recognized by implementations (see table 3-4):

<table>
<thead>
<tr>
<th>user</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNALLOCATED</td>
<td>Indicates that the time is unallocated.</td>
</tr>
<tr>
<td>PROVIDER-CSSS</td>
<td>Indicates that the time is allocated for the Provider CSSS.</td>
</tr>
</tbody>
</table>
B2.4 REGISTRY FOR \texttt{siteRef} AND \texttt{apertureRef}

The values for the ‘\texttt{siteRef}’ parameter (see table 3-7) of this Recommended Standard are those of the Site Name Abbreviation field of the Service Sites and Apertures registry. The Service Sites and Apertures registry is located at\(^2\)

\[http://sanaregistry.org/r/service_sites_apertures/\]

Although the registry allows for Site Name records with no Aperture Name field records, for effective use with this recommendation, any referenced Site Name needs to contain at least one Aperture Name field. It may contain as many fields as needed to list as many apertures found at one site as needed. The Aperture Name and Aperture Name Abbreviations are unique with respect to any other Aperture Name or Aperture Name Abbreviations for the particular Site Name.

The values for the \texttt{apertureRef} parameter (see table 3-7) of this Recommended Standard are those of the Aperture Name Abbreviation field.

The policy that governs updates to this registry is that defined in subsection 3.3.2.4 of reference [5].

B2.5 REGISTRY FOR \texttt{associationKinds}

The \texttt{associationKinds} (ScheduledPackageAssn class—see table 3-5) values are registered and maintained in SANA; the registry is located at

\[http://sanaregistry.org/r/association_kinds/\]

In accordance with reference [6], section 3.11 (c), updates to this registry are at the discretion of CCSDS member agencies or registered organizations, via the registered agency or organization representative.

REGISTRY FOR XML Schema

The XML Schema for this recommended standards is registered with SANA and is located at

\[http://sanaregistry.org/r/service_management_xml_schemas/\]

Per reference [5], updates of this type of registry are performed by CCSDS.

B2.6 REGISTRY FOR EXTENDED PARAMETER

The extended parameter requires an additional schema or schema files for validation (see reference [7], subsection 3.2.9). The content of such schema are agency specific and are

\(^2\) The URL for this Registry may not be finalized prior to final publication of this document; at time of release of this current draft it can be found at http://beta.sanaregistry.org/r/service_sites_apertures/.
outside the scope of this Recommended Standard. However, to assist with inter-agency inter-
opérations, the agency specific schema are registered.

The information registered is:

a) Agency – the agency that is registering the extended parameter;

NOTE – This should be the same as the agency name in the SANA Organizations
registry.

b) Point of Contact – the responsible party of the agency registering the particular
agency schema;

NOTE – This should one of the names found in the SANA Contacts registry.

c) Extends – the name and version of the CCSDS CSSM Schema that the agency-
specific schema is extending:

   – for extensions relative to the schema defined by this Recommended Standard, the
     CSSM Schema name is ‘SimpleSchedule’ and the version number is ‘1.0.0’;

   – multiple version numbers are supplied if the extension is compatible with and
     applies to multiple versions of the SimpleSchedule schema;

d) Description – a brief description of the type of extension being afforded by the
agency specific schema;

e) Applicable Start Date – the date when an agency recognizes and processes its
particular extended parameter conforming to the registered schema;

f) Applicable End Date – the date when an agency will no longer recognize and process
its particular extended parameter conforming to the registered schema.

NOTE – This can have the value of ‘indefinite’ if the agency has no plans for ending
implement of the agency specific extended parameter.

g) Schema file or files – the file(s) that contain the XML schema for the agency specific
extended parameter.

In accordance with reference [6], subsection3.11 (c), updates to this registry are at the
discretion of CCSDS member agencies or registered organizations, via the registered agency
or organization representative. The extended parameter registry is located at

   http://sanaregistry.org/r/agency_specific_schemas/

B2.7 USE OF UNREGISTERED VALUES

Only values that have been registered should be used for the
originatingOrganization, user and apertureRef parameters. Unregistered
values for the originatingOrganization, user, and apertureRef parameters may be used. If unregistered values are used they should be prefixed with the string ‘UNR::’.

NOTES

1 ‘UNR::’ indicates an unregistered value;

2 this helps eliminate potential confusion in a multi-agency cross support context;

3 use of unregistered values is not recommended and should be avoided if possible.

B3 PATENT CONSIDERATIONS

No patent rights are known to adhere to any of the specifications of the Recommended Standard.
ANNEX C

XML SCHEMA FOR THE SIMPLE SCHEDULE FORMAT

(INFORMATIVE)

C1 PURPOSE

This annex provides an informative listing of the normative XML schema that realizes the classes that comprise the Simple Schedule Format as defined in section 3.

C2 SCHEMA ORGANIZATION AND PACKAGING

The XML schemas for the Simple Schedule are contained in the file ‘SchemaCssmSimpleSchedule-v1_0_0.xsd’. The root element of the SchemaCssmSimpleSchedule-v1_0_0 schemas is the simpleSchedule element.

The Simple Schedule types and global elements are registered in the ‘urn:ccsds:schema:cssm:1.0.0’ name space.

The Simple Schedule schema includes the following schemas:

a) SchemaCssmSmInfoEntityHeader-v1_0_0.xsd. Types and global elements in this schema are registered in the ‘urn:ccsds:schema:cssm:1.0.0’ name space.

b) SchemaCssmCcsdsTimecodes-v1_0_0.xsd. Types and global elements in this schema are registered in the ‘urn:ccsds:schema:cssm:1.0.0’ name space.

c) SchemaCssmAbstractParameter-v1_0_0.xsd. Types and global elements in this schema are registered in the ‘urn:ccsds:schema:cssm:1.0.0’ name space.

The source of the SchemaCssmSimpleSchedule-v1_0_0.xsd, SchemaCssmSmInfoEntityHeader-v1_0_0.xsd, SchemaCssmCcsdsTimecodes-v1_0_0.xsd and SchemaCssmAbstractParameter-v1_0_0 files is the SANA SCCS-SM Information Entity XML Schemas registry:

http://sanaregistry.org/r/service_management_xml_schemas/
C3 SCHEMA

The following is a listing of the XML schema for the Simple Schedule format.

```xml
